

Base Station 2

Reliable remote irrigation management from Valley combines the ability to monitor soil moisture status with remote monitoring/control of center pivot or linear irrigation equipment with the introduction of BaseStation2-SM. The BaseStation2-SM is a dedicated, centralized irrigation management system for your home or office computer, custom-designed for your application by Valmont.

With BaseStation2-SM, growers can do, among other things:

- Control and monitor your linears and center pivots without driving to the field
- Features specialized language options: French, Spanish, Portuguese, and Italian displays available
- Voice call-out is available
- Linears can be managed with the use of the AutoPilot Linear control panel (with optional GPS)
- Updated linear mapping function now includes drawings of hydrants, swing-around function, hose feed, and ditch feed
- Screen display of the AutoPilot Linear control panel now includes graphical buttons
- Included Watermark soil moisture monitors by Irrrometer, which can be ordered directly through Valmont

With use of the BaseStation2-SM, growers will need PanelLink in order to:

- Control and monitor non-Valley control panels and non-computerized Valley control panels
- Allow BaseStation2-SM to interpret change in status messages
